

Module 02: Variables, Datatypes, Conversion, Operators, in- and output

Objective: Training of the basic features of C#

System requirements: .NET 5.0

Tools: Visual Studio 2022

ETA: ~30min

Author(s): Klaas Hagge / Benedikt Siebert

Last changed: 27.10.2021

Different velocities are to be calculated on the basis of the input of four integer values. The velocities are to be rounded to two decimal places.

1. First declare the required variables with suitable data types
2. Obtain the required inputs from the user and store them in the corresponding variables
3. Calculate the required results and store them in the appropriate variables.
4. Output the results according to the template

The output should look like this:

```
Distance in meters: 4500
Hours: 1
Minutes: 5
Seconds: 25
Meters/Second:      1.15
Kilometers/Hour:    4.13
Miles/Hour:         2.56
```

The following inputs are required for the calculation:

- distanceInMeters
- hours
- minutes
- seconds

The following variables are to be calculated:

- metersPerSecond
- kilometersPerHour
- milesPerHour

Specifications and assistance

- `Console.ReadLine();`
- `Console.WriteLine(output);`
- `Convert.To[Datentyp](input);`
- `[Datatype].Parse(input);`
- Kilometers in Miles: 1 Mile = 1.609 Kilometers
- 1 Kilometer = 0,62137119 Miles
