

Module 05: Functions

Objective: Create and call functions

System requirements: .Net 5.0

Tools: Visual Studio 2019

Duration: ~20 Min

Author(s): Klaas Hagge & Benedikt Sieverts

Last modified: 01.11.2021

1 Extend the calculator

The calculator from module04 is to be extended. Create a new project and copy the existing code. The calculation in this calculator should be done outside the Main() method. For this the calculation takes place in its own method, which gets the entered numbers and the arithmetic operation passed and the result gets returned to the Main() method.

Each method should now also output the calculation itself (see below).

The inputs are now to be checked to see if they are numeric. Use the TryParse() methods of the respective data types for this. If the input is incorrect, it is to be repeated.

Furthermore, the functionality from module 4 remains unchanged.

Output:

```
Enter a number: 12
Enter a number: 42

Choose an operation:
1: Addition
2: Subtraction
3: Multiplication
4: Division
3
12 * 42 = 504
Press Y to repeat
```
